I. INETCFG

I. INETCFG

Let `inetcfg` manage your networking commands rather than leaving them in `autoexec.ncf`

```
Current File "SYS:SYSTEM\AUTOEXEC.NCF"

FILE SERVER NAME NW1
# WARNING!!
# If you change the name of this server, you must update
# the server name in all the licenses that are assigned
# to it using iManager.
LOAD CONLOG MAXIMUM=100
LOAD TCPIP
LOAD CE1000.LAN SLOT=10013 FRAME=ETHERNET_II NAME=CE1000_1_EII
BIND IP CE1000_1_EII addr=129.67.100.202 mask=255.255.252.0 gate=129.67.103.25
MOUNT ALL
IPMINIT.NCF

SYS:\SYSTEM\NMA\NMA5.NCF
BSTART.NCF
load nile.nlm
load httpstk.nlm /SSL /keyfile:"SSL CertificateIP"
LOAD PORTAL.NLM
LOAD NDSIMON.NLM
LOAD NICISDI.XLM

Ctrl+F=Find  F3=Find Next  Ctrl+R=Replace  Esc=Exit  F1=Help
Connected
```

Run `inetcfg` at the
console

Run `inetcfg` at the console

- This transfers networking commands to `netinfo.cfg`

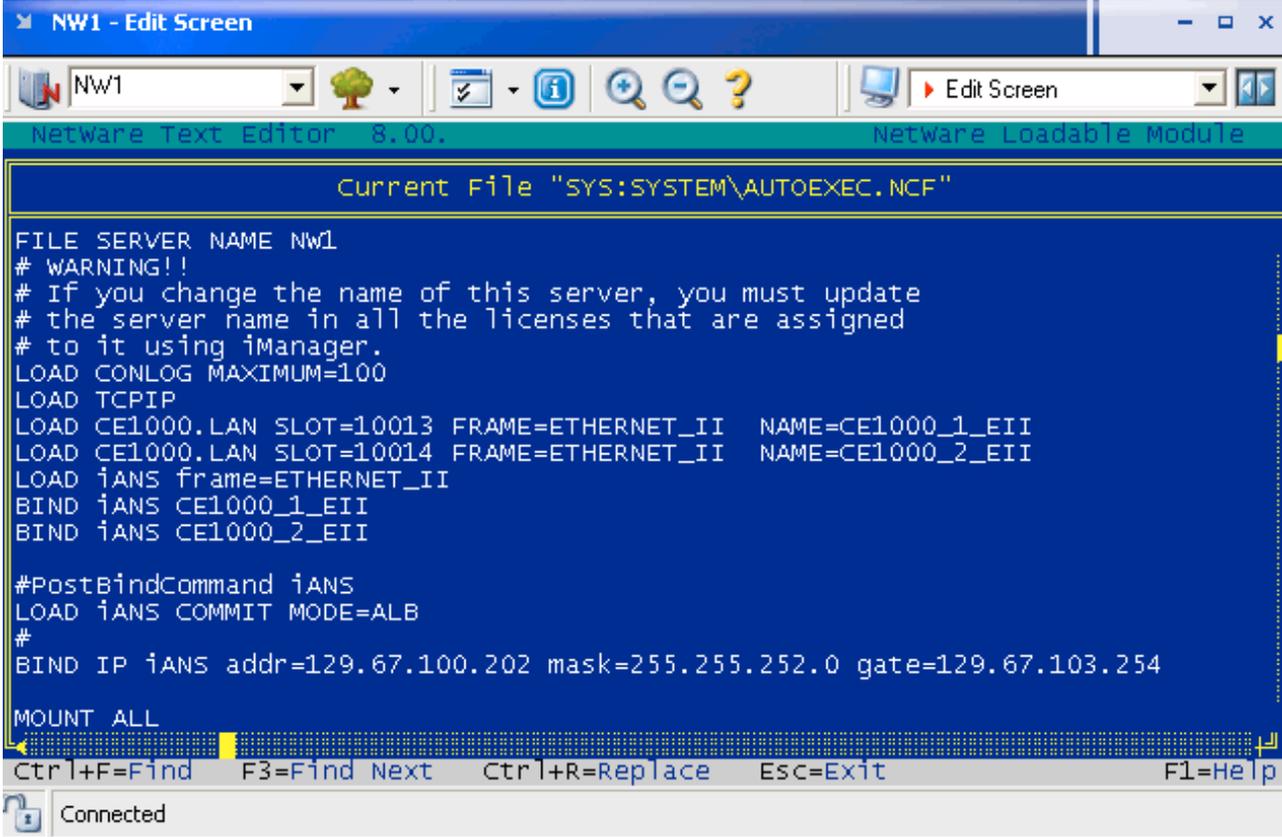

Run `inetcfg` at the console

- This transfers networking commands to `netinfo.cfg`
- Commands will be removed out of `autoexec.ncf`

Run `inetcfg` at the console

- This transfers networking commands to `netinfo.cfg`
- Commands will be removed out of `autoexec.ncf`
- This can be undone

Run `inetcfg` at the console

```
File Server Name NW1
# WARNING!!
# If you change the name of this server, you must update
# the server name in all the licenses that are assigned
# to it using iManager.
LOAD CONLOG MAXIMUM=100
LOAD TCPIP
LOAD CE1000.LAN SLOT=10013 FRAME=ETHERNET_II NAME=CE1000_1_EII
LOAD CE1000.LAN SLOT=10014 FRAME=ETHERNET_II NAME=CE1000_2_EII
LOAD iANS frame=ETHERNET_II
BIND iANS CE1000_1_EII
BIND iANS CE1000_2_EII

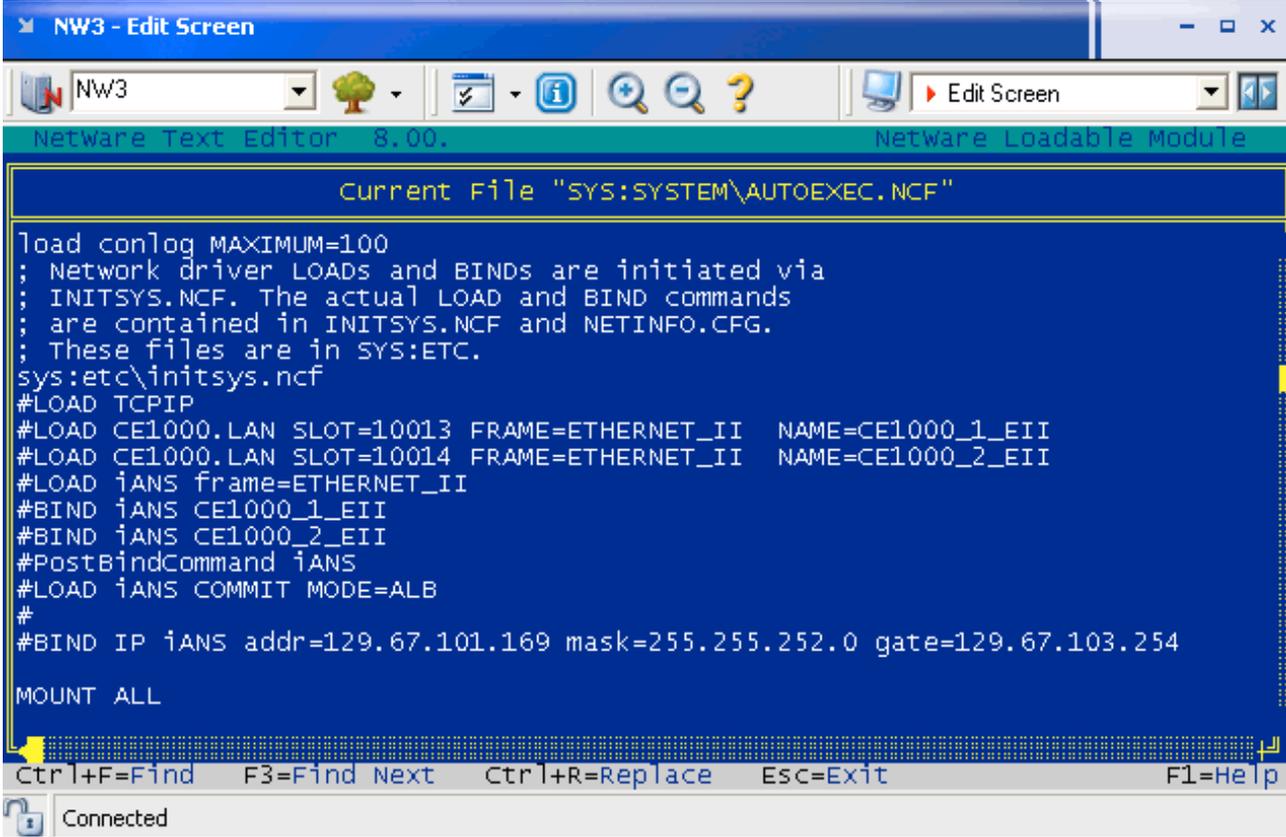

#PostBindCommand iANS
LOAD iANS COMMIT MODE=ALB
#
BIND IP iANS addr=129.67.100.202 mask=255.255.252.0 gate=129.67.103.254

MOUNT ALL
```

Ctrl+F=Find F3=Find Next Ctrl+R=Replace Esc=Exit F1=Help

Connected

Run `inetcfg` at the console

```
load conlog MAXIMUM=100
; Network driver LOADS and BINDS are initiated via
; INITSYS.NCF. The actual LOAD and BIND commands
; are contained in INITSYS.NCF and NETINFO.CFG.
; These files are in SYS:ETC.
sys:etc\initsys.ncf
#LOAD TCPIP
#LOAD CE1000.LAN SLOT=10013 FRAME=ETHERNET_II NAME=CE1000_1_EII
#LOAD CE1000.LAN SLOT=10014 FRAME=ETHERNET_II NAME=CE1000_2_EII
#LOAD iANS frame=ETHERNET_II

iANS Configuration

PostBind commands

The screenshot shows a Netware console window titled "NW3 - Edit Screen". The window displays the contents of a file named "SYS:SYSTEM\AUTOEXEC.NCF". The text in the window is as follows:

```
Current File "SYS:SYSTEM\AUTOEXEC.NCF"

load conlog MAXIMUM=100
; Network driver LOADs and BINDs are initiated via
; INITSYS.NCF. The actual LOAD and BIND commands
; are contained in INITSYS.NCF and NETINFO.CFG.
; These files are in SYS:ETC.
sys:etc\initsys.ncf
#LOAD TCPIP
#LOAD CE1000.LAN SLOT=10013 FRAME=ETHERNET_II NAME=CE1000_1_EII
#LOAD CE1000.LAN SLOT=10014 FRAME=ETHERNET_II NAME=CE1000_2_EII
#LOAD iANS frame=ETHERNET_II
#BIND iANS CE1000_1_EII
#BIND iANS CE1000_2_EII
#PostBindCommand iANS
#LOAD iANS COMMIT MODE=ALB
#
#BIND IP iANS addr=129.67.101.169 mask=255.255.252.0 gate=129.67.103.254

MOUNT ALL
```

At the bottom of the window, there is a status bar with the text "Connected" and a keyboard shortcut legend: "Ctrl+F=Find F3=Find Next Ctrl+R=Replace Esc=Exit F1=Help".

Connected

Time

- `Timesync.nlm` is now deprecated in favour of `xntpd`
- Edit `SYS:ETC\NTP.CONF` and add the following lines below
`fudge 127.127.1.0 stratum 3:`

```
server ntp0.oucs.ox.ac.uk minpoll 4  
server ntp1.oucs.ox.ac.uk minpoll 4  
server ntp2.oucs.ox.ac.uk minpoll 4
```

- Further down the file, Un-rem `stepclock`
- Edit `SYS:SYSTEM\TIMESERV.NCF` as follows:
 - REM out `LOAD TIMESYNC`
 - Un-rem `LOAD xntpd`
- Then from the console `UNLOAD TIMESYNC` then `XNTPD`

Unscoped is a general default scope. A 'Scoped' Scope is a Scope Unit that has been defined with a specific Scope name. The Unscoped Scope is a grouping of all service URL information that is not tied to a particular scope. In SLP version 1 the default scope is called the 'Unscoped scope'. In SLP version 2 it will be called the 'Default Scope'. If a DA has been configured to support a scope other than the default, it can no longer support the Unscoped scope. In SLP version 1, scope is an attribute and it only supports one scope (the 'unscoped' scope). This is a limitation of the SA. If you require more than one scope in your network and want to set up a default scope container, create a scope called the 'default scope'. Do not use the Unscoped scope in this configuration. This will make the transition to SLP version 2 later easier for the customer. SLP version 2 defines some enhancements to SLP. The basic operation of SLP does not change.

Unscoped is a general default scope. A 'Scoped' Scope is a Scope Unit that has been defined with a specific Scope name. The Unscoped Scope is a grouping of all service URL information that is not tied to a particular scope. In SLP version 1 the default scope is called the 'Unscoped scope'. In SLP version 2 it will be called the 'Default Scope'. If a DA has been configured to support a scope other than the default, it can no longer support the Unscoped scope. In SLP version 1, scope is an attribute and it only supports one scope (the 'unscoped' scope). This is a limitation of the SA. If you require more than one scope in your network and want to set up a default scope container, create a scope called the 'default scope'. Do not use the Unscoped scope in this configuration. This will make the transition to SLP version 2 later easier for the customer. SLP version 2 defines some enhancements to SLP. The basic operation of SLP does not change.

SLP is quite easy to configure

- Create a SCOPE unit for your tree in ConsoleOne. Call it something simple: **OUCS_SLP**
- Create an SLP DA (Directory Agent) object. One server will be the DA
 - A single Directory Agent (DA) is sufficient on our networks; at most, two for redundancy
- Edit **SYS:ETC\SLP.CFG** on each server so that it includes the IP address of your DA

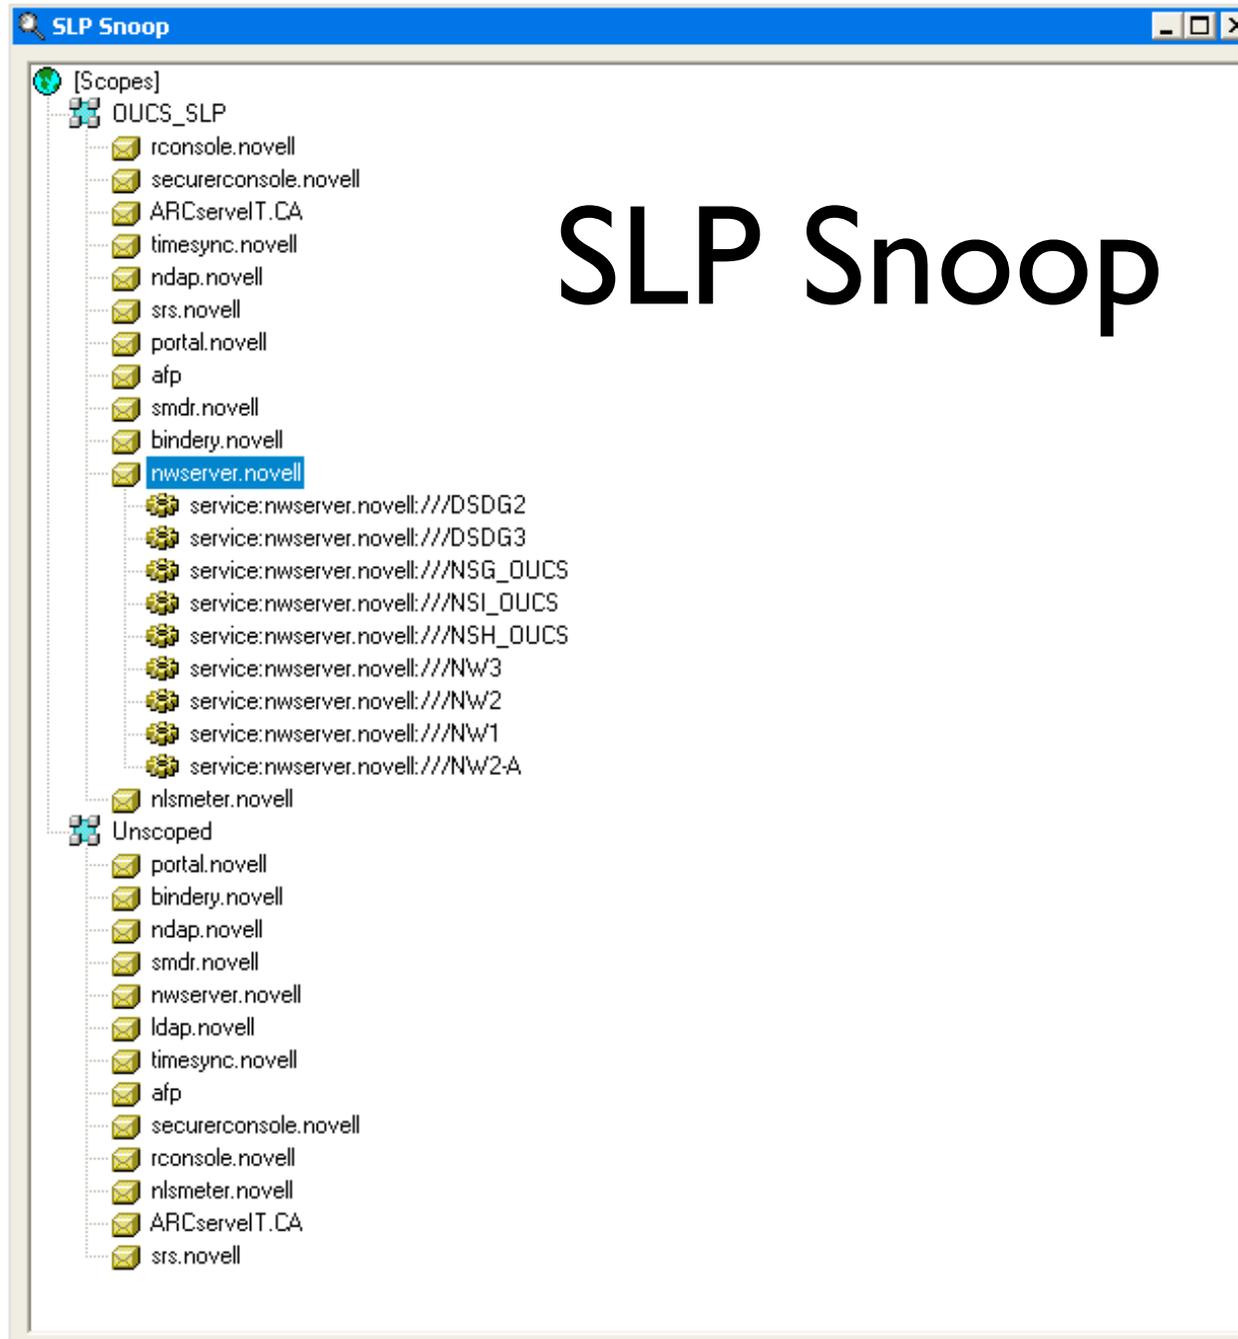

More SLP

- Enter the name of your scope in Monitor (Server Parameters / Service Location Protocol / Scope Name)
- Reload SLP by typing **SET SLP RESET=ON** at the console (a server restart is recommended by some)
- From NetWare 6.5, SLPv2 is now the *de facto* standard; it's good practice to configure your servers to be compliant
- Not doing this can cause problems such as server hangs when doing **DISPLAY SLP SERVICES**

SLP

- Configure your clients so that they point to the DA / DAs
 - On Windows you can run **slpinfo** to check that the clients are communicating correctly with the DAs
- ON OSX, enable SLP registrations in Directory Access.app
 - Config file: **/etc/slpda.conf**
 - **man slpd**
 - **man slp_reg**

SLP Snoop

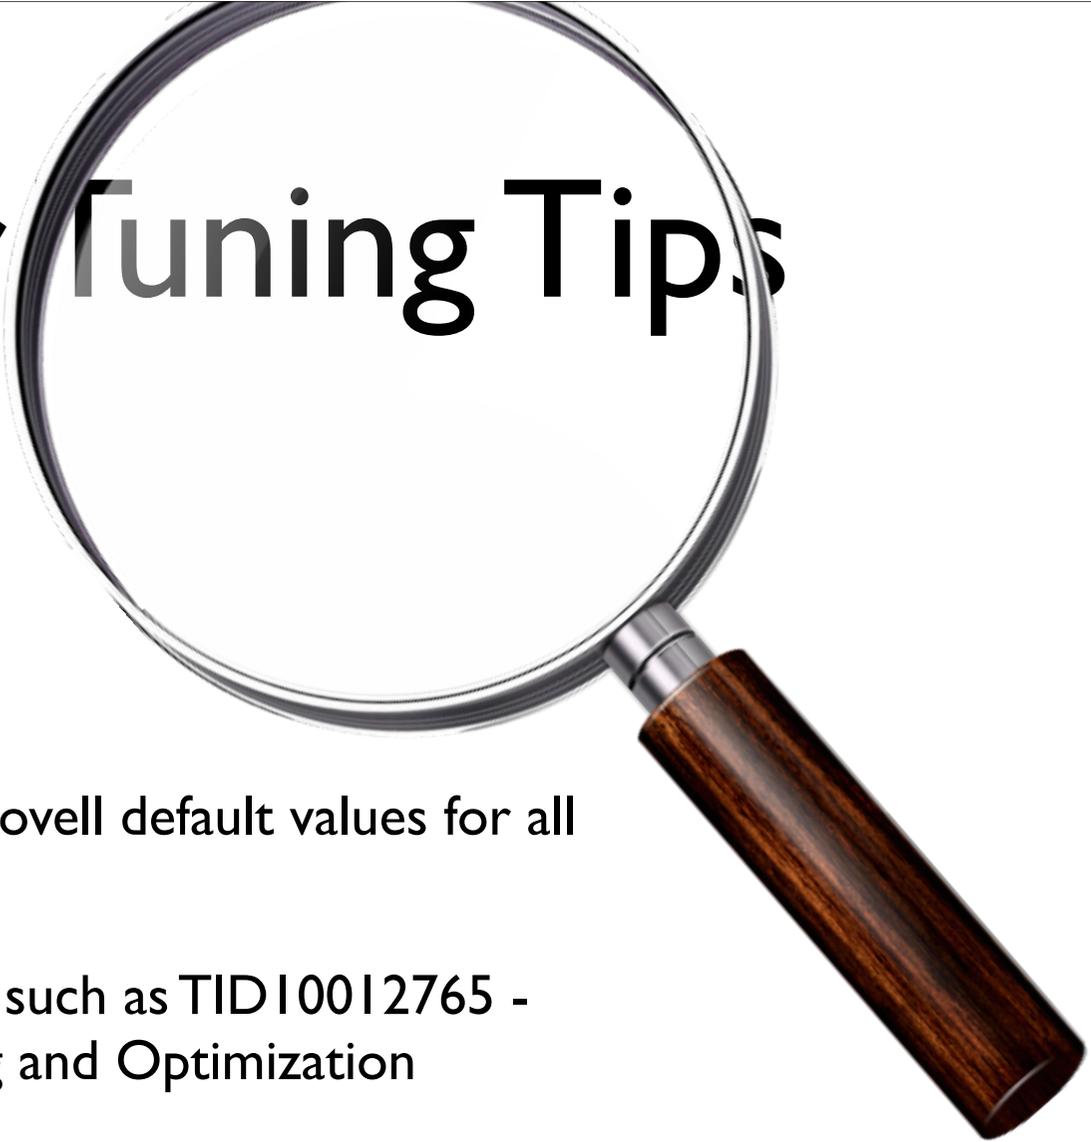

Key TIDs

- TID-10062474 SLP Design and Implementation Guidelines (01 JUL 2004)
- TID-10014466 Configuring SLP for a NetWare Client (06 MAY 2004)
- TID-10027163 Configuring SLP for a NetWare Server (11 SEP 2003)
- TID-10059981 Configuring SLP with a SCOPED directory agent (DA) (30 JUN 2004)
- TID-10061396 How to change from UNSCOPED to a named SCOPE (18 FEB 2003)
- TID-10025313 Frequently Asked Questions (FAQ) about SLP (04 DEC 2002)

Other Tuning Tips

- Don't just accept Novell default values for all server parameters
- Carefully read TIDs such as TID10012765 - Performance, Tuning and Optimization
- Always TEST parameter changes on a test server before applying them to production servers

Other Tuning Tips

- Don't just accept Novell default values for all server parameters
- Carefully read TIDs such as TID10012765 - Performance, Tuning and Optimization
- Always TEST parameter changes on a test server before applying them to production servers

Packet Receive Buffers

- In MONITOR
 - Select Server Parameters
 - Select Communications
 - Set Minimum Packet Receive Buffers to, e.g. 100
 - Set Maximum Packet Receive Buffers to, e.g. 200
- These settings may well vary depending on the load on the server, network configuration

TXTHRESHOLD

- Represents the threshold for transmits from the LAN controller
 - **TXTHRESHOLD n** [where n = number of 8 bytes]
- Maximum number is 200 - this ensures there will be no underruns
- For Intel NICs:
 - Edit **C:\NWSERVER\DRIVERS\CE100B.LDI** (or appropriate **.LDI** file for your card)
 - Scroll down to the **TXTHRESHOLD BLOCK**
 - Un-Rem: **PR TXTHRESHOLD OPT**
 - Rem: **PR TXTHRESHOLD HID**
 - Change default value (**DEF**) to '200'

Other things to look for

- Memory configuration for TSAFS.NLM
 - **LOAD TSAFS /CacheMemoryThreshold=1**
 - Edit **SYS:\ETC\SMS\TSA.CFG**
 - <http://support.novell.com/cgi-bin/search/searchtid.cgi?/10091980.htm>
- IPTables (see <http://www.mindworksuk.com>)
