Norris, C.H., Wilber, J.B. and Utku, S. (1991) 'Elementary structural analysis' Section 8.6

Grosjean, J. (1991) 'Kinematics and dynamics of mechanisms' Chapters 1 and 2.

Kinematics of a Point

1. A golfer plans to pitch a ball from point A to land on a green at point B as shown in Figure 1. The initial velocity of the ball is V_0 and is inclined at angle α to the horizontal. Find the appropriate value of V_0 when $\tan \alpha = 0.5$ and $d = \frac{3h}{4}$.

Figure 1

2. (a) The retarding acceleration a on a car is given by $a = \beta v^2 - \alpha$ where α and β are constants and v is the speed of the car. Show that the terminal speed v_t is:

$$v_t = \sqrt{\frac{\alpha}{\beta}}$$

- (b) Show also that after rolling a distance x from rest the car will have reached a speed v where:

$$x = -\frac{1}{2\beta} \ln \left(1 - \left(\frac{v}{v_t} \right)^2 \right)$$

3. In the design of a timing mechanism, the motion of the pin A in the fixed circular slot is controlled by the guide B, which is being elevated by its lead screw with a constant upward velocity $v_0 = 2$ m/s (Figure 2). Calculate both the normal and tangential components of acceleration of pin A as it passes the position for which $\theta = 30^\circ$.

Figure 2 (after Meriam & Kraige 1998)

4. A jet plane flies at an altitude $h=10$ km at a constant speed v directly over a radar, which continues to track its further flight. When the radar is pointing at the angle $q=60^\circ$ above horizon, q is decreasing at the rate of 0.02 rad/s. At this instant, determine the magnitude of the velocity v of the plane, and the value of the acceleration term \ddot{r} .

Kinematics of Rigid Bodies and Mechanisms

5. In each of the mechanisms shown in Figure 3, rod AB rotates clockwise at angular velocity ω . Draw the velocity diagrams, and for each case find the velocity of C.

Figure 3

6. The Geneva wheel is a mechanism for producing intermittent rotation (Figure 4). Pin P in the integral unit of wheel A and locking plate B engages the radial slots in wheel C thus turning wheel C one-fourth of a revolution for each revolution of the pin. At the engagement position shown, $q=45^\circ$. For a constant clockwise angular velocity $\omega_1=2$ rad/s of wheel A, determine the corresponding CCW angular velocity of wheel C for $q=20^\circ$.

(Note: the motion during engagement is governed by the geometry of triangle O_1O_2P with changing q).

Figure 4 (after Meriam & Kraige 1998)

Figure 5

7. Figure 5 shows a quick-return mechanism. The arm AB is of length r and rotates at a constant angular velocity ω . The end A is pinned on the same vertical surface as the end C of the rod CD, which is of length $5r$. The end B slides along the rod CD. The rod DE is also of length $5r$ and the end E slides in an horizontal slot. At a given instant, the rods AB, CD and ED are at 60° , 15° and 75° respectively to the vertical. From a sketch of the velocity diagram of the mechanism, find the sliding velocity of E, the sliding velocity of B along CD, and the angular velocities of CD and DE.
8. Figure 6 shows an assembly of a light piston and connecting rod AB attached to a flywheel of moment of inertia 10 kgm^2 rotating about C with a clockwise angular velocity 60 rad/s . The dimensions AB and BC are 0.6m and 0.25m .
- (a) Draw the velocity diagram for the instant when $AC = 0.65 \text{ m}$.
- (b) Find the velocity of A.
- (c) If the area of the piston is 0.007 m^2 and the pressure p is 1.2 MN/m^2 , calculate the acceleration of the flywheel at this instant if the bearings at A and B are frictionless.

Figure 6

9. Figure 7 shows the offset nose wheel of an airliner. A, D and E are pivots fixed to the frame of the aircraft. C is a pivot fixed to the undercarriage leg and F is a pivot fixed to the nose wheel door. For the case where the aircraft frame is stationary, the link AB rotates at 0.25 rad/s in the direction shown and the nose wheel makes an angle of 30° to the vertical, estimate graphically the velocity of G, the angular velocity of leg DG, and the angular velocity of the door EF. The dimensions are $AB=432\text{mm}$; $BC=229\text{mm}$; $CF=330\text{mm}$; $EF=229\text{mm}$; $DH=254\text{mm}$; $CH=63.5\text{mm}$ (perpendicular to DH); $DG=990\text{mm}$; A is 584mm to the left of D and 229 mm above D; E is 127 mm to the right of D and 63.5mm below D.

Figure 7 (after Grosjean 1991)

ANSWERS

1. $V_o = \sqrt{\frac{gh}{2}}$
2. $w_2 = 1.923 \text{ rad/s}$
3. $a_n = 21.33 \text{ m/s}^2$, $a_t = -12.32 \text{ m/s}^2$
4. $0.947 \mathbf{wr}$, $\mathbf{wr} / \sqrt{2}$, $0.211 \mathbf{w}$, $0.0566 \mathbf{w}$.
5. $V=960 \text{ km/h}$, $\ddot{r}=4.62 \text{ m/s}^2$
6. (b) 16.25 m/s ; (c) 227.5 rad/s^2
7. wL , wL , $2wL$
8. 0.48 m/s , 0.49 rad/s , 0.53 rad/s
