# INTRODUCTION TO LOGIC <br> 3 Formalisation in Propositional Logic 

Volker Halbach

If I could choose between principle and logic, I'd take principle every time.

Maggie Smith as Violet Crawley in Downton Abbey series 6, ep. 6

Last week I introduced the formal language $\mathcal{L}_{1}$ of propositional logic.

This week I'll relate $\mathcal{L}_{1}$ to English. I'll discuss how one can translate English sentences into $\mathcal{L}_{1}$-sentences and how the notions of validity etc. in $\mathcal{L}_{1}$ and English are related.

I'll explain how to translate English sentences into sentences of $\mathcal{L}_{1}$.

I'll explain how to translate English sentences into sentences of $\mathcal{L}_{1}$.

This involves two steps:

1. The English sentence is brought into a standardised form, the logical form.
2. The English connectives are replaced with connectives of $\mathcal{L}_{1}$, the remaining English sentences are replaced with sentence letters according to a dictionary that is specified.
In the Manual I sketch a general procedure for generating the logical form of a sentence; here I give only an example.

In the process of finding the logical form, one should reformulate English sentences in such a way that they are built up using the standard connectives:

| name | standard connective | some other formulations |
| :--- | :--- | :--- |
| conjunction | and | but, although, [comma] |
| disjunction | or | unless |
| negation | it is not the case that | not, none, never |
| arrow | if ... then | provided that, if... <br> only if (reversed order) <br> double arrow |
| if and only if | exactly if, <br> precisely if |  |

## Example

If Rishi gets more than 120 votes or Boris doesn't run for PM, Rishi becomes PM.

This is the English sentence.

## Example

If Rishi gets more than 120 votes or Boris doesn't run for PM, Rishi becomes PM.

It is structured like this. 'if' is its main connective.

## Example

If Rishi gets more than 120 votes or Boris doesn't run for PM, then Rishi becomes PM.

The standard connective is 'if ... then' (not just 'if').

## Example

(If Rishi gets more than 120 votes or Boris doesn't run for PM, then Rishi becomes PM)

Now that we have sentence with a standard connective, the entire sentence is put into brackets...

## Example

(If Rishi gets more than 120 votes or Boris doesn't run for PM, then Rishi becomes PM)
... and I repeat the procedure with the sentences that make up the entire sentence. First I turn to the blue sentence (order doesn't matter).

## Example

(If ( Rishi gets more than 120 votes or Boris doesn't run for PM), then Rishi becomes PM)
'or' is a standard connective. So I enclose the blue sentence in brackets.

## Example

(If ((Rishi gets more than 120 votes) or Boris doesn't run for PM), then Rishi becomes PM)

The sentence 'Rishi gets more than 120 votes' cannot be further analysed; I enclose it in brackets and turn to the red sentence, which is a negated sentence

## Example

(If ((Rishi gets more than 120 votes) or it is not the case that Boris runs for PM), then Rishi becomes PM)
... and can be reformulated with the standard connective 'it is not the case that.'

## Example

(If ((Rishi gets more than 120 votes) or it is not the case that (Boris runs for PM)), then Rishi becomes PM)

The red sentence cannot be further analysed and it put in brackets.

## Example

(If ((Rishi gets more than 120 votes) or it is not the case that (Boris runs for PM)), then (Rishi becomes PM))

The blue sentence cannot be further analysed; so it's enclosed in brackets and not further analysed...

## Example

(If ((Rishi gets more than 120 votes) or it is not the case that (Boris runs for PM)), then (Rishi becomes PM))
... and we have arrived at the logical form of the sentence.

This was very detailed.
You are not expected to learn the steps of the procedure by heart, but you need to be able to determine the logical form of a given sentence.

Going from the logical form to the formalisation in $\mathcal{L}_{1}$ involves three steps:

1. Replace standard connectives by their respective symbols in accordance with the following list:

| standard connective | symbol |
| :---: | :---: |
| and | $\wedge$ |
| or | $\vee$ |
| it is not the case that | $\neg$ |
| if ... then $\ldots$ | $\rightarrow$ |
| if and only if | $\leftrightarrow$ |

Going from the logical form to the formalisation in $\mathcal{L}_{1}$ involves three steps:

1. Replace standard connectives by their respective symbols in accordance with the following list:

| standard connective | symbol |
| :---: | :---: |
| and | $\wedge$ |
| or | $\vee$ |
| it is not the case that | $\neg$ |
| if ... then ... | $\rightarrow$ |
| if and only if | $\leftrightarrow$ |

2. Replace every English sentence by a sentence letter and delete the brackets surrounding the sentence letter.

Going from the logical form to the formalisation in $\mathcal{L}_{1}$ involves three steps:

1. Replace standard connectives by their respective symbols in accordance with the following list:

| standard connective | symbol |
| :---: | :---: |
| and | $\wedge$ |
| or | $\vee$ |
| it is not the case that | $\neg$ |
| if ... then ... | $\rightarrow$ |
| if and only if | $\leftrightarrow$ |

2. Replace every English sentence by a sentence letter and delete the brackets surrounding the sentence letter.
3. Provide a dictionary.

I'll explain the procedure using the example from above:

## Example

If Rishi gets more than 120 votes or Boris doesn't run for PM, Rishi becomes PM.

## Example

(If ((Rishi gets more than 120 votes) or it is not the case that (Boris runs for PM)) , then (Rishi becomes PM) )

This is the logical form we have already determined.

## Example

( ((Rishi gets more than 120 votes) (Boris runs for PM)) $\rightarrow$ (Rishi becomes PM) )

First I replace all standard connectives by the respective symbols.

## Example

$\left.\begin{array}{cccc} \\ Q & )^{P} \rightarrow & \vee & \neg\end{array}\right)$
In step 2 the sentences are replace by sentence letters; the brackets surrounding the sentence letters are deleted.

Thus we have $((P \vee \neg Q) \rightarrow R)$ with the following dictionary:
$P$ : Rishi gets more than 120 votes.
Q: Boris runs for PM.
$R$ : Rishi becomes PM.

There are various problems with formalising English sentences in $\mathcal{L}_{1}$ :
(i) Some English connectives aren't truth-functional.

There are various problems with formalising English sentences in $\mathcal{L}_{1}$ :
(i) Some English connectives aren't truth-functional.
(ii) In some cases the logical form cannot be uniquely determined because the English sentence is ambiguous.

There are various problems with formalising English sentences in $\mathcal{L}_{1}$ :
(i) Some English connectives aren't truth-functional.
(ii) In some cases the logical form cannot be uniquely determined because the English sentence is ambiguous.
(iii) It's not clear how much 'force' may be applied in order to reformulate an English sentence as a sentence with a standard connective.

English also contains connectives that don't correspond to standard connectives.

'It could be the case that'<br>'It must be the case that'<br>'Volker thought that'<br>'because'<br>'logically entails that'

English also contains connectives that don't correspond to standard connectives.

```
'It could be the case that'
'It must be the case that'
'Volker thought that'
'because'
'logically entails that'
```

'Volker thought that' and 'Violet likes logic' make 'Volker thought that Violet likes logic'.

None of these connectives can be can be captured in $\mathcal{L}_{1}$.

## Truth functionality

Only truth-functional connectives can be captured in $\mathcal{L}_{1}$.

## Truth functionality

Only truth-functional connectives can be captured in $\mathcal{L}_{1}$.

## Example: a truth-functional connective

The truth-value of 'It is not the case that $A$ ' is fully determined by the truth-value of $A$.

## Example: a non-truth-functional connective

 The truth-value of 'It is possibly the case that $A$ ' is not fully determined by the truth-value of $A$.
## Example: a non-truth-functional connective

 The truth-value of 'It is possibly the case that $A$ ' is not fully determined by the truth-value of $A$.| $A$ | It is possibly the case that $A$ |
| :--- | :--- |
|  |  |

## Example: a non-truth-functional connective

 The truth-value of 'It is possibly the case that $A$ ' is not fully determined by the truth-value of $A$.

## Example: a non-truth-functional connective

 The truth-value of 'It is possibly the case that $A$ ' is not fully determined by the truth-value of $A$.

## Example: a non-truth-functional connective

 The truth-value of 'It is possibly the case that $A$ ' is not fully determined by the truth-value of $A$.

## Example: a non-truth-functional connective

 The truth-value of 'It is possibly the case that $A$ ' is not fully determined by the truth-value of $A$.

## Example: a non-truth-functional connective

 The truth-value of 'It is possibly the case that $A$ ' is not fully determined by the truth-value of $A$.

Consider the false sentences $A_{1}$ and $A_{2}$
$A_{1}$ James Studd gives the lecture next week.
$A_{2}$ Two plus two equals five.

## Example: a non-truth-functional connective

 The truth-value of 'It is possibly the case that $A$ ' is not fully determined by the truth-value of $A$.

Consider the false sentences $A_{1}$ and $A_{2}$
$A_{1}$ James Studd gives the lecture next week.
$A_{2}$ Two plus two equals five.

## Example: a non-truth-functional connective

 The truth-value of 'It is possibly the case that $A$ ' is not fully determined by the truth-value of $A$.

Consider the false sentences $A_{1}$ and $A_{2}$
$A_{1}$ James Studd gives the lecture next week. ..... F
$A_{2}$ Two plus two equals five. ..... F

## Example: a non-truth-functional connective

 The truth-value of 'It is possibly the case that $A$ ' is not fully determined by the truth-value of $A$.

Consider the false sentences $A_{1}$ and $A_{2}$
$A_{1}$ James Studd gives the lecture next week. ..... F
$A_{2}$ Two plus two equals five. ..... F

It is possibly the case that $A_{1}$.
It is possibly the case that $A_{2}$.

## Example: a non-truth-functional connective

The truth-value of 'It is possibly the case that $A$ ' is not fully determined by the truth-value of $A$.

Consider the false sentences $A_{1}$ and $A_{2}$
$A_{1}$ James Studd gives the lecture next week. ..... F
$A_{2}$ Two plus two equals five. ..... F

It is possibly the case that $A_{1}$.
It is possibly the case that $A_{2}$.

## Example: a non-truth-functional connective

The truth-value of 'It is possibly the case that $A$ ' is not fully determined by the truth-value of $A$.

Consider the false sentences $A_{1}$ and $A_{2}$
$A_{1}$ James Studd gives the lecture next week. ..... F
$A_{2}$ Two plus two equals five. ..... F
It is possibly the case that $A_{1}$. ..... T
It is possibly the case that $A_{2}$. ..... F

## Characterisation: truth-functional (p. 54)

A connective is truth-functional if and only if the truth-value of the compound sentence cannot be changed by replacing a direct subsentence with another having the same truth-value.

## Characterisation: truth-functional (p. 54)

A connective is truth-functional if and only if the truth-value of the compound sentence cannot be changed by replacing a direct subsentence with another having the same truth-value.

## Characterisation: truth-functional (p. 54)

A connective is truth-functional if and only if the truth-value of the compound sentence cannot be changed by replacing a direct subsentence with another having the same truth-value.

Compound Sentence

## Characterisation: truth-functional (p. 54)

A connective is truth-functional if and only if the truth-value of the compound sentence cannot be changed by replacing a direct subsentence with another having the same truth-value.

## Characterisation: truth-functional (p. 54)

A connective is truth-functional if and only if the truth-value of the compound sentence cannot be changed by replacing a direct subsentence with another having the same truth-value.

## Characterisation: truth-functional (p. 54)

A connective is truth-functional if and only if the truth-value of the compound sentence cannot be changed by replacing a direct subsentence with another having the same truth-value.

## Characterisation: truth-functional (p. 54)

A connective is truth-functional if and only if the truth-value of the compound sentence cannot be changed by replacing a direct subsentence with another having the same truth-value.
$\underbrace{\text { Connective }}_{\text {It is not the case that }} \overbrace{\text { it is possibly the case that Sentence }}^{\underbrace{\text { Direct subsentence }}_{\text {Subsentence }_{2+2=5}^{2}}}$

## Characterisation: truth-functional (p. 54)

A connective is truth-functional if and only if the truth-value of the compound sentence cannot be changed by replacing a direct subsentence with another having the same truth-value.
$\underbrace{\text { Connective }}_{\text {It is not the case that }} \overbrace{\text { it is possibly the case that Sentence }}^{\overbrace{\text { Subsentence }}^{2+2=5}})$ Direct subsentence

## Characterisation: truth-functional (p. 54)

A connective is truth-functional if and only if the truth-value of the compound sentence cannot be changed by replacing a direct subsentence with another having the same truth-value.
$\underbrace{\text { Connective }}_{\text {It is not the case that }} \overbrace{\text { it is possibly the case that Sentence }}^{\overbrace{\text { Subsentence }}^{2+2=5}})$ Direct subsentence

## Characterisation: truth-functional (p. 54)

A connective is truth-functional if and only if the truth-value of the compound sentence cannot be changed by replacing a direct subsentence with another having the same truth-value.
$\underbrace{\text { Compound Sentence }}_{\text {It is not the case that }} \overbrace{\text { it is possibly the case that } \underbrace{2+2=5}_{\text {Subsentence }}}^{\text {Direct subsentence }}$

## Characterisation: truth-functional (p. 54)

A connective is truth-functional if and only if the truth-value of the compound sentence cannot be changed by replacing a direct subsentence with another having the same truth-value.
$\underbrace{\text { Connective }}_{\text {It is not the case that }} \overbrace{\text { it is possibly the case that Sentence }}^{\overbrace{\text { Subsentence }}^{2+2=5}})$ Direct subsentence

Compound Sentence
NB: replacing non-direct subsentences may change the truth-value.

## If ... then

The connective 'if, ... then' is usually translated as $\rightarrow$. It's surely not adequate for counterfactuals:

## Example

If I hadn't given the logic lecture last week, Boris would have given it.

Some other cases are controversial:

## Example

If the pope gives the lecture in week 4 , Volker becomes PM.

| $\phi$ | $\psi$ | $(\phi \rightarrow \psi)$ |
| :---: | :---: | :---: |
| T | T | T |
| T | F | F |
| F | T | T |
| F | F | T |

So one might doubt that 'if,... then' is always truth functional.

## Rules of thumb for $\rightarrow$

## Rules of thumb for $\rightarrow$

## Formalise:

## Rules of thumb for $\rightarrow$

## Formalise:

(i) If John revised, [then] he passed.

## Rules of thumb for $\rightarrow$

## Formalise:

(i) If John revised, [then] he passed.

Dictionary: R: John revised. P: John passed.

## Rules of thumb for $\rightarrow$

## Formalise:

(i) If John revised, [then] he passed.

\end{aligned}
$$

(ii) John passed if he revised.
(iii) John passed only if he revised.
(iv) John only passed if he revised.

Dictionary: R: John revised. P: John passed.
(i) Formalisation: $R \rightarrow P$
(ii) Paraphrase: (i). Formalisation: $R \rightarrow P$
(iii) Paraphrase: If John passed, John revised.

Formalisation: $P \rightarrow R$

## Rules of thumb for $\rightarrow$

## Formalise:

(i) If John revised, [then] he passed.

$$
\begin{aligned}
R & \rightarrow P \\
' P \leftarrow R \text { ' i.e. } R & \rightarrow P \\
P & \rightarrow R \\
P & \rightarrow R
\end{aligned}
$$

(ii) John passed if he revised.
(iii) John passed only if he revised.
(iv) John only passed if he revised.

Dictionary: R: John revised. P: John passed.
(i) Formalisation: $R \rightarrow P$
(ii) Paraphrase: (i). Formalisation: $R \rightarrow P$
(iii) Paraphrase: If John passed, John revised.

Formalisation: $P \rightarrow R$
(iv) Paraphrase: (iii). Formalisation: $P \rightarrow R$

## Ambiguity

Example
Locke is right and Reid's argument is convincing or Hume is right.

## Ambiguity

## Example

Locke is right and Reid's argument is convincing or Hume is right.
Logical form: variant (i)
(((Locke is right) and (Reid's argument is convincing)) or (Hume is right))

Logical form: variant (ii)
((Locke is right) and ((Reid's argument is convincing) or (Hume is right)))

## Ambiguity

## Example

Locke is right and Reid's argument is convincing or Hume is right.
Logical form: variant (i)
(((Locke is right) and (Reid's argument is convincing)) or (Hume is right))

Logical form: variant (ii)
((Locke is right) and ((Reid's argument is convincing) or (Hume is right)))
(i) $(P \wedge Q) \vee R$
(ii) $P \wedge(Q \vee R)$, with the following dictionary
$P$ : Locke is right
Q: Reid's argument is convincing
$R$ : Hume is right

This is a case of scope ambiguity: it's not clear whether 'and' connects 'Locke is right' and 'Reid's argument is convincing' or whether it connects 'Locke is right' and 'Reid's argument is convincing or Hume is right'.

This is a case of scope ambiguity: it's not clear whether 'and' connects 'Locke is right' and 'Reid's argument is convincing' or whether it connects 'Locke is right' and 'Reid's argument is convincing or Hume is right'.
(i) $(P \wedge Q) \vee R$
(ii) $P \wedge(Q \vee R)$

The underbraced part is the scope of (the occurrence of) $\wedge$.

This is a case of scope ambiguity: it's not clear whether 'and' connects 'Locke is right' and 'Reid's argument is convincing' or whether it connects 'Locke is right' and 'Reid's argument is convincing or Hume is right'.
(i) $\underbrace{(P \wedge Q)} \vee R$
(ii) $\underbrace{P \wedge(Q \vee R)}$

The underbraced part is the scope of (the occurrence of) $\wedge$.

## Definition (scope of a connective)

The scope of an occurrence of a connective in a sentence $\phi$ is (the occurrence of) the smallest subsentence of $\phi$ that contains this occurrence of the connective.

## Reformulations

## Example

Tom and Mary are tall.

## Reformulations

## Example

Tom is tall and Mary is tall.
This reformulation is ok.

## Reformulations

## Example

Tom is tall and Mary is tall.
This reformulation is ok.

## Example

Tom and Mary are married.

## Reformulations

## Example

Tom is tall and Mary is tall.
This reformulation is ok.

## Example

Tom is married and Mary is married.
This reformulation is arguably not correct.

## Validity, logical truths etc.

The sentence of $\mathcal{L}_{1}$ that is obtained by translating an English sentence into the language of propositional logic is the formalisation of that sentence.

## Validity, logical truths etc.

The sentence of $\mathcal{L}_{1}$ that is obtained by translating an English sentence into the language of propositional logic is the formalisation of that sentence.

As we have just seen, the formalisation may not be uniquely determined because of ambiguity (and also because one may use different sentence letters; but the choice of sentence letters doesn't matter for what follows).

## Definition

(i) An English sentence is a tautology (propositionally valid) if and only if its formalisation in propositional logic is logically true (that is, iff it is a tautology).

## Definition

(i) An English sentence is a tautology (propositionally valid) if and only if its formalisation in propositional logic is logically true (that is, iff it is a tautology).
(ii) An English sentence is a propositional contradiction if and only if its formalisation in propositional logic is a contradiction.

## Definition

(i) An English sentence is a tautology (propositionally valid) if and only if its formalisation in propositional logic is logically true (that is, iff it is a tautology).
(ii) An English sentence is a propositional contradiction if and only if its formalisation in propositional logic is a contradiction.
(iii) An argument in English is propositionally valid if and only if its formalisation in $\mathcal{L}_{1}$ is valid.

In order to check whether an argument is propositionally valid, one can proceed in the following way:

1. Formalise all sentences in the argument in $\mathcal{L}_{1}$.
2. Check whether the resulting $\mathcal{L}_{1}$-argument is valid (e.g. using a truth table).
For tautologies and propositional contradiction we proceed in a similar way.

I show that the following argument is propositionally valid.

## Example

Either $\mathrm{CO}_{2}$-emissions are being cut or there will be more floods. It is not the case that $\mathrm{CO}_{2}$-emissions are being cut. Therefore there will be more floods.

I'll deal with the sentences one by one.

## FIRST PREMISS

Either $\mathrm{CO}_{2}$-emissions are being cut or there will be more floods.

## FIRST PREMISS

Either $\mathrm{CO}_{2}$-emissions are being cut or there will be more floods.

## LOGICAL FORM

(( $\mathrm{CO}_{2}$-emissions are being cut) or (there will be more floods))
I'm not quite sure whether 'either or' is exclusive, but I think it isn't.

## FORMALISATION

$(P \vee Q)$
$P: \quad \mathrm{CO}_{2}$-emissions are being cut
$Q$ : there will be more floods

## SECOND PREMISS

It is not the case that $\mathrm{CO}_{2}$-emissions are being cut.

## SECOND PREMISS

It is not the case that $\mathrm{CO}_{2}$-emissions are being cut.

## LOGICAL FORM

It is not the case that ( $\mathrm{CO}_{2}$-emissions are being cut)

## SECOND PREMISS

It is not the case that $\mathrm{CO}_{2}$-emissions are being cut.

## LOGICAL FORM

It is not the case that ( $\mathrm{CO}_{2}$-emissions are being cut)

## FORMALISATION

$\neg P$
Of course I must use the same dictionary:
$P: \quad \mathrm{CO}_{2}$-emissions are being cut
$Q$ : there will be more floods

## CONCLUSION

There will be more floods.

## CONCLUSION

There will be more floods.

## LOGICAL FORM

(There will be more floods)

## CONCLUSION

There will be more floods.

## LOGICAL FORM

(There will be more floods)

## FORMALISATION

Q
P: $\quad \mathrm{CO}_{2}$-emissions are being cut
$Q$ : there will be more floods

## So the premisses are formalised as $(P \vee Q)$ and $\neg P$ and the conclusion as $Q$.

So the premisses are formalised as $(P \vee Q)$ and $\neg P$ and the conclusion as $Q$.

Next I show that the corresponding $\mathcal{L}_{1}$-argument is valid:
$(P \vee Q), \neg P \vDash Q$

So the premisses are formalised as $(P \vee Q)$ and $\neg P$ and the conclusion as $Q$.

Next I show that the corresponding $\mathcal{L}_{1}$-argument is valid:
$(P \vee Q), \neg P \vDash Q$

| $P$ | $Q$ | $(P \vee Q)$ | $\neg P$ | $Q$ |
| :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |

I want to show the claim using a partial truth table.

So the premisses are formalised as $(P \vee Q)$ and $\neg P$ and the conclusion as $Q$.

Next I show that the corresponding $\mathcal{L}_{1}$-argument is valid:

$$
(P \vee Q), \neg P \vDash Q
$$

| $P$ | $Q$ | $(P \vee Q)$ | $\neg P$ | $Q$ |
| :---: | :---: | :---: | :---: | :---: |
|  |  | T | T | F |

I want to show the claim using a partial truth table. I assume that there is a $\mathcal{L}_{1}$-structure (i.e. a line in the truth table that makes all premisses true and the conclusion false).

So the premisses are formalised as $(P \vee Q)$ and $\neg P$ and the conclusion as $Q$.

Next I show that the corresponding $\mathcal{L}_{1}$-argument is valid:

$$
(P \vee Q), \neg P \vDash Q
$$

| $P$ | $Q$ | $(P \vee Q)$ | $\neg P$ | $Q$ |
| :---: | :---: | :---: | :---: | :---: |
|  |  | T F | T | F |

I want to show the claim using a partial truth table. I assume that there is a $\mathcal{L}_{1}$-structure (i.e. a line in the truth table that makes all premisses true and the conclusion false). Since $Q$ is false and $P \vee Q$ is true,

So the premisses are formalised as $(P \vee Q)$ and $\neg P$ and the conclusion as $Q$.

Next I show that the corresponding $\mathcal{L}_{1}$-argument is valid:

$$
(P \vee Q), \neg P \vDash Q
$$

| $P$ | $Q$ | $(P \vee Q)$ | $\neg P$ | $Q$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | T | T | F | T |

I want to show the claim using a partial truth table. I assume that there is a $\mathcal{L}_{1}$-structure (i.e. a line in the truth table that makes all premisses true and the conclusion false). Since $Q$ is false and $P \vee Q$ is true, $P$ must be true.

So the premisses are formalised as $(P \vee Q)$ and $\neg P$ and the conclusion as $Q$.

Next I show that the corresponding $\mathcal{L}_{1}$-argument is valid:

$$
(P \vee Q), \neg P \vDash Q
$$

| $P$ | $Q$ | $(P \vee Q)$ | $\neg P$ | $Q$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | T | T | F | $\mathrm{~T} ~ ?$ |

I want to show the claim using a partial truth table. I assume that there is a $\mathcal{L}_{1}$-structure (i.e. a line in the truth table that makes all premisses true and the conclusion false). Since $Q$ is false and $P \vee Q$ is true, $P$ must be true. But now $P$ must also be false!

So the premisses are formalised as $(P \vee Q)$ and $\neg P$ and the conclusion as $Q$.

Next I show that the corresponding $\mathcal{L}_{1}$-argument is valid:
$(P \vee Q), \neg P \vDash Q$

| $P$ | $Q$ | $(P \vee Q)$ | $\neg P$ | $Q$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | T T | F | $\mathrm{T} ?$ | F |

I want to show the claim using a partial truth table. I assume that there is a $\mathcal{L}_{1}$-structure (i.e. a line in the truth table that makes all premisses true and the conclusion false). Since $Q$ is false and $P \vee Q$ is true, $P$ must be true. But now $P$ must also be false! Hence there cannot be a line in which both premisses are true and the conclusion is false.

So the premisses are formalised as $(P \vee Q)$ and $\neg P$ and the conclusion as $Q$.

Next I show that the corresponding $\mathcal{L}_{1}$-argument is valid:

$$
(P \vee Q), \neg P \vDash Q
$$

| $P$ | $Q$ | $(P \vee Q)$ | $\neg P$ | $Q$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | T T | F | $\mathrm{T} ~ ? ~$ | F |

I want to show the claim using a partial truth table. I assume that there is a $\mathcal{L}_{1}$-structure (i.e. a line in the truth table that makes all premisses true and the conclusion false). Since $Q$ is false and $P \vee Q$ is true, $P$ must be true. But now $P$ must also be false! Hence there cannot be a line in which both premisses are true and the conclusion is false.

Thus, the English argument is propositionally valid.

The following sentence is a tautology:

## Example

If Violet doesn't like logic, then she is stubborn or she doesn't like logic.

## FORMALISATION

$P \rightarrow(Q \vee P)$
$P$ : Violet doesn't like logic
Q: Violet is stubborn
Here we don't need a full formalisation.

When determining whether an English argument is propositionally valid, it doesn't matter which sentence letters are used (as long as we use the same letters for the same English sentences and different letters for different English sentences).

When determining whether an English argument is propositionally valid, it doesn't matter which sentence letters are used (as long as we use the same letters for the same English sentences and different letters for different English sentences).

An English argument is propositionally valid independently of the 'meaning' of the sentences that are replaced by sentence letters.

Analogous remarks apply to logical truths and propositional contradictions.

There are arguments that are logically valid without being propositionally valid.

## Example

Zeno is a tortoise. All tortoises are toothless. Therefore Zeno is toothless.
$P: \quad$ Zeno is a tortoise.
Dictionary $Q$ : All tortoises are toothless.
$R$ : Zeno is toothless.
But the argument with $P$ and $Q$ as premisses and $R$ as conclusion isn't valid, while the English argument is.

There are arguments that are logically valid without being propositionally valid.

## Example

Zeno is a tortoise. All tortoises are toothless. Therefore Zeno is toothless.
$P: \quad$ Zeno is a tortoise.
Dictionary $Q$ : All tortoises are toothless.
$R$ : Zeno is toothless.
But the argument with $P$ and $Q$ as premisses and $R$ as conclusion isn't valid, while the English argument is.

We need a more powerful formal language: $\mathcal{L}_{2}$.
