

# IPP-SR-4: Einstein's 1905 derivation of the Lorentz transformations

James Read<sup>1</sup>

<sup>1</sup>Faculty of Philosophy, University of Oxford, UK, OX2 6GG

HT20

# The course

1. Newton's laws
2. Galilean invariance
3. The Michelson-Morley experiment
4. Einstein's 1905 derivation of the Lorentz transformations
5. Spacetime structure
6. General covariance
7. Relativity and conventionality of simultaneity
8. Frame-dependent effects
9. The twin paradox
10. Dynamical and geometrical approaches to relativity
11. Presentism and relativity
12. Acceleration and redshift

# Today

Einstein's 1905 paper

Einstein versus Lorentz

Einstein's misgivings about his 1905 derivation

The Ignatowski transformations

# Introduction

- ▶ In 1905, Einstein published four papers in the journal *Annalen der Physik*, each of which precipitated a revolution in physics. The papers were on:
  1. The photoelectric effect.
  2. Brownian motion.
  3. Special relativity.
  4. Mass-energy equivalence.

# Introduction

- ▶ In 1905, Einstein published four papers in the journal *Annalen der Physik*, each of which precipitated a revolution in physics. The papers were on:
  1. The photoelectric effect.
  2. Brownian motion.
  3. Special relativity.
  4. Mass-energy equivalence.
- ▶ The year would come to be known as Einstein's *annus mirabilis*.

# Introduction

- Einstein's 1905 derivation of the Lorentz transformations in his third *annus mirabilis* paper, *On the Electrodynamics of Moving Bodies*, purports to account for all ether wind experiment null results, without recourse to dynamical considerations *à la* Lorentz *et al.*

# Introduction

- ▶ Einstein's 1905 derivation of the Lorentz transformations in his third *annus mirabilis* paper, *On the Electrodynamics of Moving Bodies*, purports to account for all ether wind experiment null results, without recourse to dynamical considerations *à la* Lorentz *et al.*
- ▶ In effect, it elevates contraction from a dynamical effect to a kinematical effect: *all physics must be conditioned such that it is invariant under Lorentz boosts.*

# Distinctive features of Einstein's approach

Distinctive features of Einstein's 1905 approach include that:

1. It eliminates “asymmetries which do not appear to be inherent in the phenomena” (1905). (Here, Einstein is referring to Lorentz's responses to the ether wind null results.)

# Distinctive features of Einstein's approach

Distinctive features of Einstein's 1905 approach include that:

1. It eliminates “asymmetries which do not appear to be inherent in the phenomena” (1905). (Here, Einstein is referring to Lorentz's responses to the ether wind null results.)
2. It accounts for *all* null ether-wind results.

# Distinctive features of Einstein's approach

Distinctive features of Einstein's 1905 approach include that:

1. It eliminates “asymmetries which do not appear to be inherent in the phenomena” (1905). (Here, Einstein is referring to Lorentz's responses to the ether wind null results.)
2. It accounts for *all* null ether-wind results.
3. It does not postulate a luminiferous ether, or a standard of absolute rest, at all.

# Distinctive features of Einstein's approach

Distinctive features of Einstein's 1905 approach include that:

1. It eliminates “asymmetries which do not appear to be inherent in the phenomena” (1905). (Here, Einstein is referring to Lorentz's responses to the ether wind null results.)
2. It accounts for *all* null ether-wind results.
3. It does not postulate a luminiferous ether, or a standard of absolute rest, at all.
4. It is a ‘principle theory’, rather than a ‘constructive theory’.

# Einstein's insight

*Examples of this sort, together with the unsuccessful attempts to discover any motion of the earth relatively to the “light medium,” suggest that the phenomena of electrodynamics as well as of mechanics possess no properties corresponding to the idea of absolute rest. They suggest rather that, as has already been shown to the first order of small quantities, the same laws of electrodynamics and optics will be valid for all frames of reference for which the equations of mechanics hold good. (Einstein 1905)*

# What of the ether?

*The introduction of a “luminiferous ether” will prove to be superfluous inasmuch as the view here to be developed will not require an ‘absolutely stationary space’ provided with special properties, nor assign a velocity-vector to a point of the empty space in which electromagnetic processes take place. (Einstein 1905)*

Einstein versus Lorentz

Einstein's misgivings about his 1905 derivation

The Ignatowski transformations

# Principle and constructive theories

Famously, Einstein wrote in the London *Times* in 1919 that:

# Principle and constructive theories

Famously, Einstein wrote in the London *Times* in 1919 that:

*Most [theories in physics] are constructive. They attempt to build up a picture of the more complex phenomena out of the materials of a relatively simple formal scheme from which they start out. Thus, the kinetic theory of gases seeks to reduce mechanical, thermal, and diffusional processes to movements of molecules*

...

# Principle and constructive theories

Famously, Einstein wrote in the London *Times* in 1919 that:

*Most [theories in physics] are constructive. They attempt to build up a picture of the more complex phenomena out of the materials of a relatively simple formal scheme from which they start out. Thus, the kinetic theory of gases seeks to reduce mechanical, thermal, and diffusional processes to movements of molecules ...*

*[Principle theories, by contrast,] employ the analytic, not the synthetic method. The elements which form their basis and starting point are not hypothetically constructed but empirically discovered ones, general characteristics of natural processes, principles that give rise to mathematically formulated criteria which the separate processes ... have to satisfy ... The theory of relativity belongs to the latter class.*

# Principle and constructive theories

- ▶ A *constructive theory* is a theory that attempts to provide a detailed dynamical picture of what is microscopically going on, from which predictions for observable phenomena can be derived.

# Principle and constructive theories

- ▶ A *constructive theory* is a theory that attempts to provide a detailed dynamical picture of what is microscopically going on, from which predictions for observable phenomena can be derived.
- ▶ A *principle theory* is a theory that takes certain ‘phenomenologically well-grounded principles’, raises them to the status of *postulates*, and derives from them constraints on what the underlying detailed dynamical equations could be like, without attempting to give a fully detailed account of what those equations *are*.

# Paradigm example

- ▶ Thermodynamics is a principle theory; the ‘phenomenologically well-grounded postulates’ in this case are the laws of thermodynamics:
  - 1LT: When energy passes, as work, as heat, or with matter, into or out of a system, the system’s internal energy changes in accord with the law of conservation of energy.
  - 2LT: In a natural thermodynamic process, the sum of the entropies of the interacting thermodynamic systems increases.
  - 3LT: The entropy of a system approaches a constant value as the temperature approaches absolute zero.

# Paradigm example

- ▶ Thermodynamics is a principle theory; the 'phenomenologically well-grounded postulates' in this case are the laws of thermodynamics:
  - 1LT: When energy passes, as work, as heat, or with matter, into or out of a system, the system's internal energy changes in accord with the law of conservation of energy.
  - 2LT: In a natural thermodynamic process, the sum of the entropies of the interacting thermodynamic systems increases.
  - 3LT: The entropy of a system approaches a constant value as the temperature approaches absolute zero.
- ▶ From these we derive relations between functions of state.

# Paradigm example

- ▶ Thermodynamics is a principle theory; the 'phenomenologically well-grounded postulates' in this case are the laws of thermodynamics:
  - 1LT: When energy passes, as work, as heat, or with matter, into or out of a system, the system's internal energy changes in accord with the law of conservation of energy.
  - 2LT: In a natural thermodynamic process, the sum of the entropies of the interacting thermodynamic systems increases.
  - 3LT: The entropy of a system approaches a constant value as the temperature approaches absolute zero.
- ▶ From these we derive relations between functions of state.
- ▶ The corresponding constructive theory would be the (statistical) kinetic theory of gases.

# Motivating principle theories

- ▶ One might be motivated to construct a principle theory by wanting to make *some* progress, before the fully detailed microphysical picture (constructive account) is known.

# Motivating principle theories

- ▶ One might be motivated to construct a principle theory by wanting to make *some* progress, before the fully detailed microphysical picture (constructive account) is known.
- ▶ Einstein in 1905 sees himself as being in this situation: Lorentz has been pursuing a constructive approach, but Einstein is bothered by deep suspicions that the true equations governing intermolecular forces are very far from being known.

# Einstein's reservations

It is, however, worth registering Einstein's reservations about principle theories:

*It seems to me ... that a physical theory can be satisfactory only when it builds up its structures from elementary foundations. (Einstein 1908)*

*... when we say we have succeeded in understanding a group of natural processes, we invariably mean that a constructive theory has been found which covers the processes in question. (Einstein 1919)*

# Today

Principle and constructive theories

**Einstein's 1905 paper**

Einstein versus Lorentz

Einstein's misgivings about his 1905 derivation

The Ignatowski transformations

# Einstein's operational understanding of coordinates

- ▶ Einstein's operational understanding of coordinates means that he requires spatial coordinates to 'match' the length of rigid measuring rods that are at rest in the system in question, and time coordinates to 'match' the tickings of clocks at rest in that system.

# Einstein's operational understanding of coordinates

- ▶ Einstein's operational understanding of coordinates means that he requires spatial coordinates to 'match' the length of rigid measuring rods that are at rest in the system in question, and time coordinates to 'match' the tickings of clocks at rest in that system.
- ▶ But even to set up *one* coordinate system, we need more than this: we need to *decide* how to synchronise clocks that are spatially separated from one another.

# Definition of simultaneity

# Definition of simultaneity

- ▶ Which point on the worldline of mirror  $A$  is simultaneous with point  $B_2$  on the worldline of mirror  $B$ ?

# Definition of simultaneity

- ▶ Which point on the worldline of mirror  $A$  is simultaneous with point  $B_2$  on the worldline of mirror  $B$ ?
- ▶ Natural answer stipulated by Einstein:

$$t_B(B_2) = t_A(A_1) + \frac{1}{2} (t_A(A_3) - t_A(A_1)).$$

# Definition of simultaneity

- ▶ Which point on the worldline of mirror  $A$  is simultaneous with point  $B_2$  on the worldline of mirror  $B$ ?
- ▶ Natural answer stipulated by Einstein:

$$t_B(B_2) = t_A(A_1) + \frac{1}{2} (t_A(A_3) - t_A(A_1)).$$

- ▶ This makes the one-way speed of light isotropic.

# Definition of simultaneity

- ▶ Which point on the worldline of mirror  $A$  is simultaneous with point  $B_2$  on the worldline of mirror  $B$ ?
- ▶ Natural answer stipulated by Einstein:

$$t_B(B_2) = t_A(A_1) + \frac{1}{2} (t_A(A_3) - t_A(A_1)).$$

- ▶ This makes the one-way speed of light isotropic.
- ▶ (**Question:** Is this the *only* way of ‘spreading time through space’ in special relativity? We will see more on this in lecture 7...)

# Einstein's two postulates

- RP: The laws by which the states of physical systems undergo change are not affected, whether these changes be referred to the one or the other of two systems of coordinates in uniform translatory motion.
- LP: Any ray of light moves in the 'stationary' system of coordinates with the determined velocity  $c$ , whether the ray be emitted by a stationary or by a moving body. Hence [*sic?*]

$$\text{velocity} = \frac{\text{light path}}{\text{time interval}},$$

where time interval is to be taken in the sense of the definition in section 1.

# The constancy of the speed of light

Note that LP does *not* state that the speed of light is the same in all inertial frames—though that follows straightforwardly from RP and LP.

# Deriving the Lorentz transformations

The game is now to derive coordinate transformations from these (and a couple of other) principles. In particular, Einstein will also need to assume:

# Deriving the Lorentz transformations

The game is now to derive coordinate transformations from these (and a couple of other) principles. In particular, Einstein will also need to assume:

1. The homogeneity of space and time. ('Every point in space and time is the same as every other.')

# Deriving the Lorentz transformations

The game is now to derive coordinate transformations from these (and a couple of other) principles. In particular, Einstein will also need to assume:

1. The homogeneity of space and time. ('Every point in space and time is the same as every other.')
2. The isotropy of space. ('There is no privileged direction in space.')

# Deriving the Lorentz transformations

The game is now to derive coordinate transformations from these (and a couple of other) principles. In particular, Einstein will also need to assume:

1. The homogeneity of space and time. ('Every point in space and time is the same as every other.')
2. The isotropy of space. ('There is no privileged direction in space.')
3. 'Reciprocity': If two inertial coordinate systems  $S$  and  $S'$  are such that  $S'$  is moving with speed  $v$  in the positive  $x$  direction relative to  $S$ , then  $S$  is moving with speed  $v$  in the negative  $x$  direction relative to  $S'$ .

# Reciprocity as an independent assumption?

- ▶ In 1969, Berzi and Gorini proved that the combination of RP and spatial isotropy implies Reciprocity.

# Reciprocity as an independent assumption?

- ▶ In 1969, Berzi and Gorini proved that the combination of RP and spatial isotropy implies Reciprocity.
- ▶ But their proof is non-trivial, and would not have been known to Einstein.

# Reciprocity as an independent assumption?

- ▶ In 1969, Berzi and Gorini proved that the combination of RP and spatial isotropy implies Reciprocity.
- ▶ But their proof is non-trivial, and would not have been known to Einstein.
- ▶ So as a reconstruction *of Einstein*, we should assume Reciprocity as a separate assumption.

# Reciprocity as an independent assumption?

- ▶ In 1969, Berzi and Gorini proved that the combination of RP and spatial isotropy implies Reciprocity.
- ▶ But their proof is non-trivial, and would not have been known to Einstein.
- ▶ So as a reconstruction *of Einstein*, we should assume Reciprocity as a separate assumption.
- ▶ (On these matters, see also (Brown 2005, p. 107).)

# Homogeneity and linearity

- ▶ Homogeneity implies that the transformations between inertial frames must be linear.

# Homogeneity and linearity

- ▶ Homogeneity implies that the transformations between inertial frames must be linear.
- ▶ Einstein doesn't spell out how this works, but a reconstruction can be found in (Brown 2005, §2.3).

# Homogeneity and linearity

- Generic transformations between frames can be written

$$x'^{\mu} = f^{\mu}(x^{\nu}).$$

# Homogeneity and linearity

- Generic transformations between frames can be written

$$x'^{\mu} = f^{\mu}(x^{\nu}).$$

- Suppose that the transformations encode information on the behaviour of rods and clocks (recall Einstein's operational understanding of coordinate systems).

# Homogeneity and linearity

- ▶ Generic transformations between frames can be written

$$x'^{\mu} = f^{\mu}(x^{\nu}).$$

- ▶ Suppose that the transformations encode information on the behaviour of rods and clocks (recall Einstein's operational understanding of coordinate systems).
- ▶ Then such behaviour should not depend on where the rods and clocks find themselves in space or time, on pains of violation of homogeneity.

# Homogeneity and linearity

- Generic transformations between frames can be written

$$x'^{\mu} = f^{\mu}(x^{\nu}).$$

- Suppose that the transformations encode information on the behaviour of rods and clocks (recall Einstein's operational understanding of coordinate systems).
- Then such behaviour should not depend on where the rods and clocks find themselves in space or time, on pains of violation of homogeneity.
- Consider now the infinitesimal version of the above transformation law,

$$dx'^{\mu} = \frac{\partial f^{\mu}}{\partial x^{\nu}} dx^{\nu}.$$

# Homogeneity and linearity

- Generic transformations between frames can be written

$$x'^{\mu} = f^{\mu}(x^{\nu}).$$

- Suppose that the transformations encode information on the behaviour of rods and clocks (recall Einstein's operational understanding of coordinate systems).
- Then such behaviour should not depend on where the rods and clocks find themselves in space or time, on pains of violation of homogeneity.
- Consider now the infinitesimal version of the above transformation law,

$$dx'^{\mu} = \frac{\partial f^{\mu}}{\partial x^{\nu}} dx^{\nu}.$$

- Homogeneity implies that the coefficients  $\partial f^{\mu}/\partial x^{\nu}$  must be independent of the  $x^{\nu}$  coordinates, which means that  $f^{\mu}$  must be linear functions of the coordinates  $x^{\mu}$ .

# Back to Einstein

- Let  $K$  be a 'stationary' system, and let  $(t, x, y, z)$  be coordinates for  $K$ , determined by the conditions of surveyability-using-rods-and-clocks-that-are-stationary-in- $K$  and the Einstein definition of simultaneity applied in  $K$  (for  $t$ ).

# Back to Einstein

- ▶ Let  $K$  be a ‘stationary’ system, and let  $(t, x, y, z)$  be coordinates for  $K$ , determined by the conditions of surveyability-using-rods-and-clocks-that-are-stationary-in- $K$  and the Einstein definition of simultaneity applied in  $K$  (for  $t$ ).
- ▶ Let  $k$  be a system of coordinates that is moving with speed  $v$  along the positive  $x$ -direction relative to the ‘stationary’ system  $K$ . Let  $(\tau, \xi, \eta, \zeta)$  be coordinates for  $k$ , determined by the conditions of surveyability-using-rods-and-clocks-that-are-stationary-in- $k$  and the Einstein definition of simultaneity applied in  $k$  (for  $\tau$ ).

# Lorentz transformations, up to $\phi(v)$

- Using Einstein synchrony in  $k$  and the linearity of the coordinate transformations, one derives

$$\tau = \phi(v) \gamma \left( t - \frac{vx}{c^2} \right).$$

# Lorentz transformations, up to $\phi(v)$

- Using Einstein synchrony in  $k$  and the linearity of the coordinate transformations, one derives

$$\tau = \phi(v) \gamma \left( t - \frac{vx}{c^2} \right).$$

- Consider a light ray emitted from the origin in the positive  $\xi$  direction. Use RP and LP to write down expressions for the relationship between  $\xi$  and  $\tau$  that holds on the path of this ray, and similarly (using RP alone) for the relationship between  $x$  and  $t$  that holds on the path of this ray. From this, one derives

$$\xi = \phi(v) \gamma (x - vt).$$

# Lorentz transformations, up to $\phi(v)$

- ▶ Using Einstein synchrony in  $k$  and the linearity of the coordinate transformations, one derives

$$\tau = \phi(v) \gamma \left( t - \frac{vx}{c^2} \right).$$

- ▶ Consider a light ray emitted from the origin in the positive  $\xi$  direction. Use RP and LP to write down expressions for the relationship between  $\xi$  and  $\tau$  that holds on the path of this ray, and similarly (using RP alone) for the relationship between  $x$  and  $t$  that holds on the path of this ray. From this, one derives

$$\xi = \phi(v) \gamma (x - vt).$$

- ▶ Similarly, by considering rays of light emitted in the  $\eta$  and  $\zeta$  directions from the perspectives of both  $K$  and  $k$ , one obtains

$$\begin{aligned}\eta &= \phi(v) y, \\ \xi &= \phi(v) z.\end{aligned}$$

# Final steps

- ▶ Invoke RP and Reciprocity to argue that  $\phi(v)\phi(-v) = 1$ .

# Final steps

- ▶ Invoke RP and Reciprocity to argue that  $\phi(v)\phi(-v) = 1$ .
- ▶ Given Einstein's operational understanding of coordinates,  $\phi(v)$  can be interpreted physically as the inverse of the *transverse length contraction factor*, i.e., the factor by which setting a body in motion causes that body to shrink in the direction perpendicular to its motion.

# Final steps

- ▶ Invoke RP and Reciprocity to argue that  $\phi(v)\phi(-v) = 1$ .
- ▶ Given Einstein's operational understanding of coordinates,  $\phi(v)$  can be interpreted physically as the inverse of the *transverse length contraction factor*, i.e., the factor by which setting a body in motion causes that body to shrink in the direction perpendicular to its motion.
- ▶ Given that interpretation, isotropy entails that  $\phi(v) = \phi(-v)$ .

# Final steps

- ▶ Invoke RP and Reciprocity to argue that  $\phi(v)\phi(-v) = 1$ .
- ▶ Given Einstein's operational understanding of coordinates,  $\phi(v)$  can be interpreted physically as the inverse of the *transverse length contraction factor*, i.e., the factor by which setting a body in motion causes that body to shrink in the direction perpendicular to its motion.
- ▶ Given that interpretation, isotropy entails that  $\phi(v) = \phi(-v)$ .
- ▶ We argue somehow against the rogue possibility that  $\phi(v) = -1$  (using continuity and  $\phi(0) = +1$ ?)

# Final steps

- ▶ Invoke RP and Reciprocity to argue that  $\phi(v)\phi(-v) = 1$ .
- ▶ Given Einstein's operational understanding of coordinates,  $\phi(v)$  can be interpreted physically as the inverse of the *transverse length contraction factor*, i.e., the factor by which setting a body in motion causes that body to shrink in the direction perpendicular to its motion.
- ▶ Given that interpretation, isotropy entails that  $\phi(v) = \phi(-v)$ .
- ▶ We argue somehow against the rogue possibility that  $\phi(v) = -1$  (using continuity and  $\phi(0) = +1$ ?)
- ▶ It follows that  $\phi(v) = 1$ . This yields the Lorentz transformations!

# Back to Michelson-Morley

- ▶ Einstein's 1905 result predicts the null result of ether wind experiments, such as that of Michelson and Morley, once and for all. Indeed, it does so *trivially*—just by insisting upon the RP.

# Back to Michelson-Morley

- ▶ Einstein's 1905 result predicts the null result of ether wind experiments, such as that of Michelson and Morley, once and for all. Indeed, it does so *trivially*—just by insisting upon the RP.
- ▶ One way to understand Einstein is as insisting that *mechanics* should also be Poincaré invariant—he is making Poincaré invariance universal, as a *kinematical constraint*.

**Einstein versus Lorentz**

Einstein's misgivings about his 1905 derivation

The Ignatowski transformations

# Einstein versus the trailblazers

- ▶ The standard line is that the ether theorists were not impressed with Einstein. For example, Lorentz wrote:

*Einstein simply postulates what we have deduced, with some difficulty and not altogether satisfactorily, from the fundamental equations of the electromagnetic field.*  
(Lorentz 1916, p. 230)

# Einstein versus the trailblazers

- ▶ The standard line is that the ether theorists were not impressed with Einstein. For example, Lorentz wrote:  
*Einstein simply postulates what we have deduced, with some difficulty and not altogether satisfactorily, from the fundamental equations of the electromagnetic field.*  
(Lorentz 1916, p. 230)
- ▶ Actually, Lorentz followed this statement with a concession:  
*By doing so, he may certainly take credit for making us see in the negative [i.e., null] result of experiments like those of Michelson, Rayleigh and Brace, not a fortuitous compensation of opposing effects but the manifestation of a general and fundamental principle.*  
(Lorentz 1916, p. 230)

# Einstein versus the trailblazers

Einstein versus Lorentz

**Einstein's misgivings about his 1905 derivation**

The Ignatowski transformations

# Einstein's misgivings

Einstein would later voice certain misgivings about his 1905 derivation, in particular regarding:

# Einstein's misgivings

Einstein would later voice certain misgivings about his 1905 derivation, in particular regarding:

1. The treatment of rods and clocks as primitive bodies, not “moving atomic configurations”. (1921, 1949)

# Einstein's misgivings

Einstein would later voice certain misgivings about his 1905 derivation, in particular regarding:

1. The treatment of rods and clocks as primitive bodies, not “moving atomic configurations”. (1921, 1949)
2. The special role of light. (1935, 1949)

# Einstein's misgivings: rods and clocks

*"One is struck [by the fact] that the theory [of special relativity] ... introduces two kinds of physical things, i.e. (1) measuring rods and clocks, (2) all other things, e.g., the electromagnetic field, the material point, etc. This, in a certain sense, is inconsistent; strictly speaking measuring rods and clocks would have to be represented as solutions of the basic equations (objects consisting of moving atomic configurations), not, as it were, as theoretically self-sufficient entities. However, the procedure justifies itself because it was clear from the very beginning that the postulates of the theory are not strong enough to deduce from them sufficiently complete equations ... in order to base upon such a foundation a theory of measuring rods and clocks. ... But one must not legalize the mentioned sin so far as to imagine that intervals are physical entities of a special type, intrinsically different from other variables ('reducing physics to geometry', etc.). (Einstein 1969)*

# Einstein's misgivings: the role of light

*The special theory of relativity grew out of the Maxwell electromagnetic equations. But ... the Lorentz transformation, the real basis of special-relativity theory, in itself has nothing to do with the Maxwell theory. (Einstein 1935)*

# Einstein's misgivings: the role of light

*The special theory of relativity grew out of the Maxwell electromagnetic equations. But ... the Lorentz transformation, the real basis of special-relativity theory, in itself has nothing to do with the Maxwell theory. (Einstein 1935)*

*[T]he Lorentz transformation transcended its connection with Maxwell's equations and had to do with the nature of space and time in general.  
(Einstein 1955)*

# The mature Einstein

*The content of the restricted relativity theory can accordingly be summarised in one sentence: all natural laws must be so conditioned that they are covariant with respect to Lorentz transformations. (Einstein 1954)*

# Today

Principle and constructive theories

Einstein's 1905 paper

Einstein versus Lorentz

Einstein's misgivings about his 1905 derivation

**The Ignatowski transformations**

# Ignatowski's approach

- ▶ Ignatowski seeks to derive the Lorentz transformations using the RP, but *without the LP*.

# Ignatowski's approach

- ▶ Ignatowski seeks to derive the Lorentz transformations using the RP, but *without the LP*.
- ▶ This claim should elicit suspicion: which of the remaining assumptions is violated by Newtonian physics (complete with Galilean transformation—cf. again the fable of Keinstein)?

# The Ignatowski transformations

The Ignatowski transformations read as follows, where  $K$  is some hitherto-unspecified universal constant:

$$t' = \left(1 - Kv^2\right)^{-1/2} (t - Kvx),$$

$$x' = \left(1 - Kv^2\right)^{-1/2} (x - vt),$$

$$y' = y,$$

$$z' = z.$$

# The Ignatowski transformations

The Ignatowski transformations read as follows, where  $K$  is some hitherto-unspecified universal constant:

$$\begin{aligned}t' &= \left(1 - Kv^2\right)^{-1/2} (t - Kvx), \\x' &= \left(1 - Kv^2\right)^{-1/2} (x - vt), \\y' &= y, \\z' &= z.\end{aligned}$$

Note now three special cases:

1. Setting  $K = 0$  yields a Galilean transformation.
2. Setting  $K = 1$  yields a Lorentz transformation.
3. Setting  $K = -1$  yields a Euclidean transformation.

# Rebutting Ignatowski

- ▶ These results vindicate our suspicion: Galilean, Lorentz, and Euclidean transformations are thus all special cases of the Ignatowski transformations.

# Rebutting Ignatowski

- ▶ These results vindicate our suspicion: Galilean, Lorentz, and Euclidean transformations are thus all special cases of the Ignatowski transformations.
- ▶ So dropping the LP is not sufficient to derive the Lorentz transformations.

# Rebutting Ignatowski

- ▶ These results vindicate our suspicion: Galilean, Lorentz, and Euclidean transformations are thus all special cases of the Ignatowski transformations.
- ▶ So dropping the LP is not sufficient to derive the Lorentz transformations.
- ▶ Sometimes, authors rule out  $K = -1$  as “unphysical” (see e.g. Pelissetto and Testa 2015)—to this one should also object, for there are plenty of physical applications of theories with Euclidean symmetries—e.g., any theory which uses the Poisson equation.

# Summary

In this lecture, we have:

# Summary

In this lecture, we have:

1. Articulated the distinction between principle and constructive theories.

# Summary

In this lecture, we have:

1. Articulated the distinction between principle and constructive theories.
2. Witnessed Einstein's 1905 derivation of the Lorentz transformations.

# Summary

In this lecture, we have:

1. Articulated the distinction between principle and constructive theories.
2. Witnessed Einstein's 1905 derivation of the Lorentz transformations.
3. Discussed Lorentz's response to that derivation, and questioned the radicality of Einstein's manoeuvres.

# Summary

In this lecture, we have:

1. Articulated the distinction between principle and constructive theories.
2. Witnessed Einstein's 1905 derivation of the Lorentz transformations.
3. Discussed Lorentz's response to that derivation, and questioned the radicality of Einstein's manoeuvres.
4. Discussed Einstein's misgivings about his 1905 derivation.

# Summary

In this lecture, we have:

1. Articulated the distinction between principle and constructive theories.
2. Witnessed Einstein's 1905 derivation of the Lorentz transformations.
3. Discussed Lorentz's response to that derivation, and questioned the radicality of Einstein's manoeuvres.
4. Discussed Einstein's misgivings about his 1905 derivation.
5. Considered, following Ignatowski, the enriched class of transformations derivable once the LP is dropped.
