“*WTS-2 b: a hot Jupiter orbiting near its tidal destruction radius around a K-dwarf*”

Article summary: Demonstrated that by measuring the transit arrival times of hot Jupiters, the gradual decay of their orbits can be directly observed over the next decade, placing stringent constraints on the effect of stellar interior structure on tidal dissipation and the survival rate of close-in planets.

“*Detection of water absorption in the dayside atmosphere of HD 189733 b using ground-based high-resolution spectroscopy at 3.2 microns*”

Article summary: First robust ground-based detection of water in an exoplanet atmosphere. First proof that ground-based high-resolution spectroscopy can be used to identify complex molecules, including potential biosignatures, even in the presence of significant contamination from Earth’s atmosphere.

Fast spin of the young extrasolar planet beta Pictoris b

Article summary: This paper measured the length of an exoplanet day for the first time and showed that its rotation velocity is consistent with an extrapolation of the Solar System mass-rotation velocity relationship, indicating a possible method for distinguishing between different modes of giant planet formation. It was the first demonstration that high-resolution spectroscopy from the ground can determine the dynamics of exoplanet atmospheres.

Four ultra-short-period eclipsing M-dwarf binaries in the WFCAM Transit Survey
Article summary: This paper demonstrated that ultra-short-period M-dwarf binaries (< 0.2 days) cannot have achieved such close orbits within the lifetime of the Universe, suggesting that current theories may be significantly underestimating the magnetic activity levels of these small stars, causing serious implications for characterizing the atmospheres and habitability of their planetary companions. I played a significant role in advising and co-writing this paper with the first author who was a graduate student at the time.
